

# INVERTED SHAFT SEALS

## OSBR

### DESCRIPTION

The OSBR profile is an inverted shaft seal composed of a single external metal cage with a rubber coating on the inside and the end of the cage, and a primary sealing lip with integrated spring.

### ADVANTAGES

- Good radial rigidity, particularly for large diameters
- Good stability when assembled, preventing the bounce-back effect
- Improved static sealing
- Good thermal expansion compensation
- Good heat transfer
- Sealing for low and high viscosity fluids
- Modern primary sealing lip with low radial forces
- Suitable for rotating hubs with a fixed shaft

#### Roundness tolerance

Shaft diameter Ød1 (mm)	Apparent metal cage	Rubber coating
Ød1 ≤ 50.0	0.18	0.25
50.0 < Ød1 ≤ 80.0	0.25	0.35
80.0 < Ød1 ≤ 120.0	0.30	0.50
120.0 < Ød1 ≤ 180.0	0.40	0.65
180.0 < Ød1 ≤ 300.0	0.25% of the inside diameter	0.80
300.0 < Ød1 ≤ 500.0	0.25% of the inside diameter	1.00

#### Tolerance for the outside diameter of the seal (ØD)

Free and without constraint, the outside diameter of the sealing lip is always bigger than the diameter of the rotating hub. The pre-tightening or interference denotes the difference between these two values. Depending on the hub diameter, the diameter of the sealing lip is generally considered to be greater, between 0.8 and 3.5 mm.

**TECHNICAL DATA**

**Speed**

**Pressure**

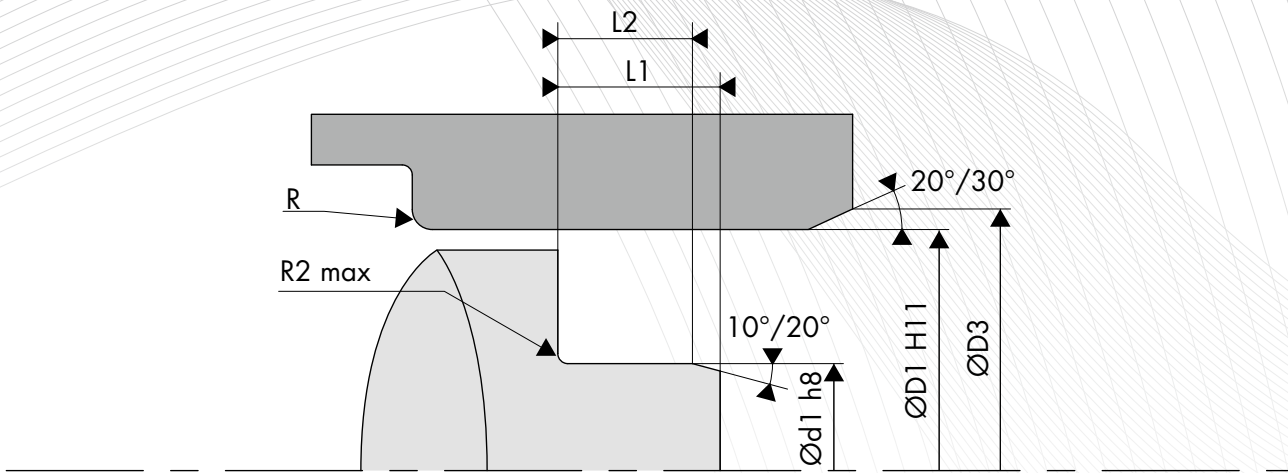

The inverted shaft seals are generally used in unpressurised environments, or for pressures between 0.02 and 0.05 MPa (maximum).

Linear speed calculation:

$$s \text{ (m/s)} = \frac{\text{rotating hub } \varnothing \text{ (mm)} \times \text{speed (rpm)} \times \pi}{60,000}$$
