

## ○ V'RINGS

### 1. Description

V'Rings are seal parts that are very often combined with other types of seals such as radial shaft seals. They are also used as the primary seal in other cases. As they offer optimal axial sealing, V'Rings are used to protect the metal parts against dirt, grease, oil and dust. They are frequently used in mechanical transmissions, rolling-mills, machine tools, etc.

As a technical component made completely of rubber, V'Rings have three parts:

- the body: the thickest part of the seal, which is clamped in place on the rotating axle and permits rotation.
- the hinge: the part connecting the sealing lip to the body of the seal, which provides a certain amount of flexibility, thus preventing significant position stresses.
- the sealing lip: the part that compensates for radial runout (angle deviations in the rotating axle) as well as significant tolerance gaps other than those recommended by its flexibility. It therefore ensures sealing on the opposing metal surface.

Stretched on the shaft, the V'Ring must be positioned at a precise distance in relation to the opposing metal friction surface (or back) to guarantee optimal sealing under axial pre-stressing of the sealing lip. The V'Ring turns with the rotating shaft and depending on the circumferential speed, the centrifugal force acting on the sealing lip repels it on the outside, which reduces compression. Beyond a certain speed, the sealing lip must not come into constant contact with the opposing metal wall, as sealing is not guaranteed.

## 2. Materials

### 2.1 RUBBERS

The table below provides an overview of the different rubber families.

| ABBREVIATION<br>ISO 1629<br>ASTM 1418 | FRANCE JOINT<br>CODE | CHEMICAL NAME                           |
|---------------------------------------|----------------------|---|
| ACM                                   | B                    | Polyacrylate                            |
| AEM                                   | V                    | Ethylene acrylate rubber                |
| EPDM                                  | C                    | Ethylene Propylene Diene Monomer rubber |
| FKM                                   | G                    | Fluorinated rubber                      |
| HNBR                                  | HK                   | Hydrogenated Nitrile Butadiene rubber   |
| NBR                                   | K                    | Nitrile Butadiene rubber                |

#### ● ACM (Polyacrylate)

Polymers containing ethyl acrylate (or butyl acrylate) have a small amount of monomer, which is necessary for cross-linking; ACM is a material with better heat resistance than NBR. It is often used for automatic gearboxes.

**Chemical resistance** Mineral oils (motor oils, gear box oils, ATF oils)  
Atmospheric and ozone agents

**Compatibility issue** Glycol-based brake fluids (Dot 3 & 4)  
Aromatic and chlorinated hydrocarbons  
Water and steam  
Acids, alkalis and amines

**Temperature range** -25°C / +150°C (short-term peak at +160°C)

#### ● AEM (ethylene acrylate rubber)

As a methyl acrylate and ethylene copolymer, AEM is considered to be better resistant to heat than ACM. Its characteristics make it an intermediary between the ACM and FKM.

**Resistance to chemicals** Cooling fluids  
Aggressive mineral oils  
Atmospheric agents  
Water

**Compatibility issue** Aromatic solvents  
Strong acids  
Brake fluids  
Gearbox oils  
ATF oils

**Temperature range** -40°C/+150°C

## ● **EPDM (Ethylene Propylene Diene Monomer rubber)**

As an Ethylene Propylene Diene Monomer copolymer, EPDM is commonly used for hot water taps, cooling systems, brake systems, dishwashers and washing machines.

### Resistance to chemicals

Hot water and steam up to +150°C  
 Glycol-based brake fluids (Dot 3 & 4) and silicone-based brake fluids (Dot 5)  
 Organic and inorganic acids  
 Cleaning agents, sodium and potassium alkalis  
 Hydraulic fluids (HFD-R)  
 Silicone oils and greases  
 Polar solvents (alcohols, ketones and esters)  
 Atmospheric and ozone agents

### Compatibility issue

Mineral oils and greases  
 Hydrocarbons  
 Low impermeability to gas

### Temperature range

-45°C / +150°C (short-term peak at +175°C)

## ● **FKM (fluorinated rubber)**

Depending on their structure and fluorine content, fluoroelastomers can vary in terms of chemical resistance and resistance to cold. This FKM-based rubber is very often used for high-temperature hydraulics and pneumatics, for industrial valves, injection/fuel systems, motor seals and high-vacuum systems.

### Resistance to chemicals

Mineral oils and greases, ASTM n°1, IRM 902 and IRM 903 oils.  
 Fire-resistant liquids (HFD)  
 Silicone oils and greases  
 Mineral and vegetable oils and greases  
 Aliphatic hydrocarbons (propane, butane, petroleum)  
 Aromatic hydrocarbons (benzene, toluene)  
 Chlorinated hydrocarbons (trichloroethylene)  
 Fuel (including high alcohol content)  
 Atmospheric and ozone agents

### Compatibility issue

Glycol-based brake fluids  
 Ammonia gas  
 Organic acids with a low molecular weight (formic and acetic acids)

### Temperature range

-20°C / +200°C (short-term peak at +230°C)

## ● **HNBR (Hydrogenated Nitrile Butadiene Rubber)**

This HNBR-based elastomer is obtained through selective hydrogenation of the NBR's butadiene groups. It is commonly used for power-assisted steering and for air conditioning.

### Chemical resistance

Aliphatic hydrocarbons  
 Mineral and vegetable oils and greases  
 Fire-resistant fluids (HFA, HFB and HFC)  
 Diluted acids, saline solutions and bases for operation at an average temperature  
 Water and steam up to +150°C  
 Atmospheric and ozone agents

### Compatibility issue

Chlorinated hydrocarbons  
 Polar solvents (ketones, esters and ethers)  
 Strong acids

### Temperature range

-30°C / +150°C (short-term peak at +160°C)

## ● NBR (Nitrile Butadiene Rubber)

Nitrile rubber (NBR) is the general term for acrylonitrile-butadiene copolymer. The ACN content can vary between 18% and 50%. While the acrylonitrile content is important, the resistance to oil and fuel is more so. Conversely, the elasticity and compression set are not as good. The NBR has good mechanical properties and good wear resistance. However, its resistance to atmospheric agents and the ozone is relatively low.

### Chemical resistance

Aliphatic hydrocarbons (propane, butane, petroleum, diesel fuel)  
 Mineral oils and greases  
 Fire-resistant fluids (HFA, HFB and HFC)  
 Diluted acids, low-temperature alkaline and saline solutions  
 Water (up to +100°C max)

### Compatibility issue

Fuels with high aromatic content  
 Aromatic hydrocarbons (benzene)  
 Chlorinated hydrocarbons (trichlorethylene)  
 Polar solvents (ketone, acetone, acetic acid, ethylene-ester)  
 Strong acids  
 Glycol-based brake fluids  
 Atmospheric and ozone agents

### Temperature range

-30°C / +100°C (short-term peak at +120°C)

## 2.2 CHEMICAL COMPATIBILITY

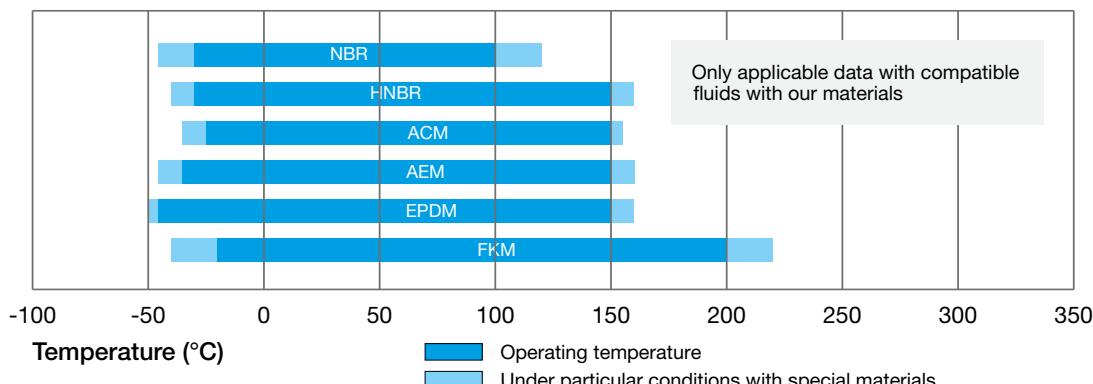

A "Chemical compatibility guide" catalogue can be downloaded from our website: [www.francejoint.com](http://www.francejoint.com)

You can also use our online "**Chemical compatibility**" tool free of charge.

These two tools enable you to measure the behaviour of our materials that come into contact with the majority of existing fluids. The data displayed is the result of rigorous testing at the ambient temperature and takes previous publications into consideration. Test results are not fully representative because of the specific features of your application. The tests performed actually do not consider additives and impurities that may exist under actual conditions of use, nor the potential elevation of temperatures. Other parameters can also alter the behaviour of our materials, such as the hardness, compression set, abrasion, etc. We therefore recommend performing your own tests to verify the compatibility of our materials depending on your specific application. Our technical team can provide you with any additional information.

## 2.3 TEMPERATURE RESISTANCE

The temperature strongly influences the physical properties of materials. The graph below sets out the temperature limits for each material. However, we can provide custom-made hybrids depending on your needs (e.g. NBR or FKM capable of withstanding temperatures of -40°C)

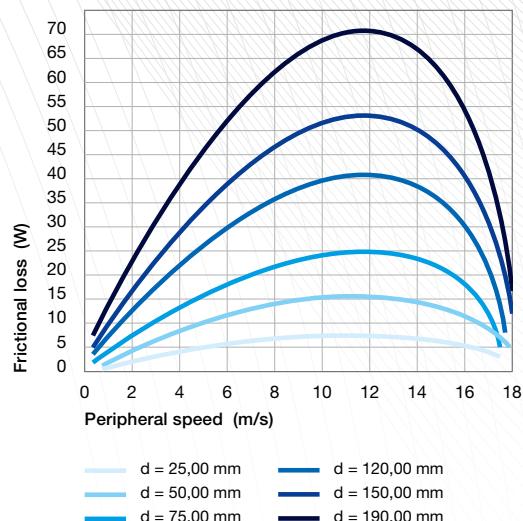

### 3. Technical data

#### 3.1 LOSS OF POWER

The sealing lip of a V'Ring exerts such a low pressure on the contact surface area that the loss of power resulting from it is also low. The variations in power loss depend on the circumferential speed as well as the diameter of the axis in rotation, as shown in the graph below.

At speeds greater than 11 m/sec, the sealing lip has a tendency to detach itself, as the centrifugal force is greater.

#### 3.2 SHAFT DESIGN

Considering that the V'Ring is stretched and tightened on the shaft, it is driven into rotation with the shaft. The tolerance and surface roughness requirements ( $R_a \leq 3.2 \mu\text{m}$ ) are relatively moderate. We recommend carefully selecting the size using the dimensional chart for applications in which power loss and V'Ring lifespan are important criteria. If the diameter of the shaft  $\varnothing d_1$  overlaps two potential V'Ring choices, we recommend selecting the larger V'Ring. The tightness on the shaft will in fact reduce, like the contact pressure of the lip on the back.

#### 3.3 DESIGN OF THE BACK

##### a. Surface roughness

The quality of the back side considerably influences the lifespan of the V'Ring in contact. The surface roughness on the back side is determined according to the fluid to be slaked and the circumferential speed of the shaft.

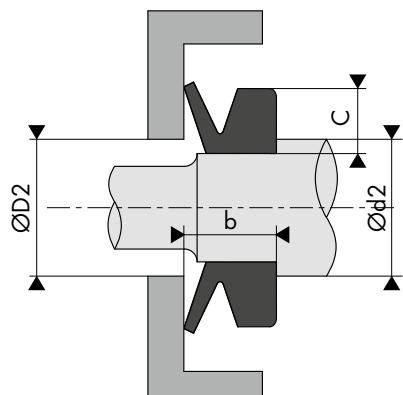

| Roughness $R_a$                       | Circumferential speed $v$ | Media                                |
|---------------------------------------|---------------------------|--------------------------------------|
| 0.40 $\mu\text{m} - 0.80 \mu\text{m}$ | > 10.0 m/sec              | Oil, water                           |
| 0.80 $\mu\text{m} - 1.60 \mu\text{m}$ | 5.0 m/sec - 10.0 m/sec    | Oil splashes, grease, water splashes |
| 1.60 $\mu\text{m} - 2.00 \mu\text{m}$ | 1.0 m/sec - 5.0 m/sec     | Grease, dirt, water splashes         |
| 2.00 $\mu\text{m} - 2.50 \mu\text{m}$ | < 1.0 m/s                 | Grease, dirt                         |

The surface roughness on the back side must not exceed  $R_a 0.05 \mu\text{m}$ .

##### b. Flatness

The flatness of the back is essential, even more so when rotation speeds are high. The maximum acceptable deviation is 0.40 mm for 100.00 mm.

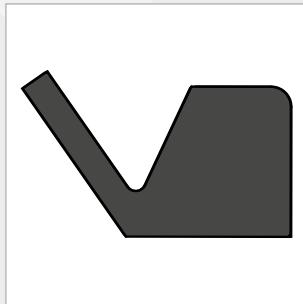

#### 3.4 AXIAL SUPPORT

Installing the V'Ring is recommended when the axial support is at full stop. This is also recommended for applications where tightening between the V'Ring and the shaft is relatively weak and where the circumferential speed will exceed 6.0 - 8.0 m/sec.

The table below sets out the calculation method for the diameter of the support  $\varnothing d_2$ .

| V'Ring profiles | Diameter $\varnothing d_2$          |
|-----------------|-------------------------------------|
| BECA 120VA      | $\varnothing d_1 + 0.50 \times C$   |
| BECA 120VE      | $\varnothing d_1 + 9.00 \text{ mm}$ |
| BECA 120VL      | $\varnothing d_1 + 3.00 \text{ mm}$ |
| BECA 120VS      | $\varnothing d_1 + 0.50 \times C$   |

## V'RINGS BECA 120VA

### DESCRIPTION

The BECA 120VA profile is a standard rubber facial effect V'Ring composed of a flat rear face.

### ADVANTAGES

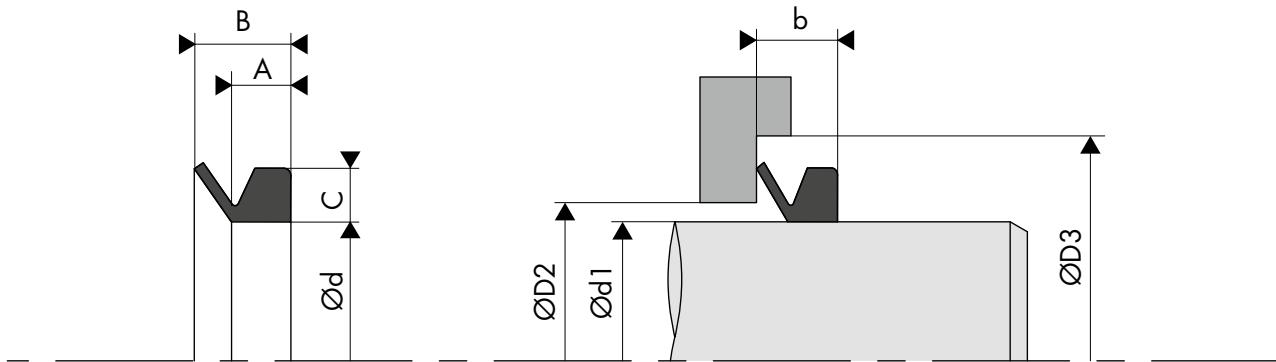

Excellent chemical compatibility and wide temperature range, depending on the type of material chosen  
Low friction  
Good elasticity

### APPLICATIONS

Electric motors  
Power transmissions  
Bearing protections

### MATERIALS

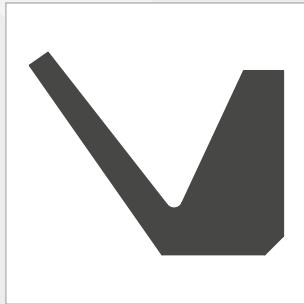

FKM 60 and 70 Shore A  
NBR 60 and 70 Shore A

### DIMENSIONS

| Part number | Shaft diameter Ød1 | Inside diameter Ød | Width before fitting B | Height of the body C | Width of the body A | Width after fitting b | ØD2 Max  | ØD3 Min   |
|-------------|--------------------|--------------------|------------------------|----------------------|---------------------|-----------------------|----------|-----------|
| 120.VA003   | 2.7 - 3.4          | 2.50               | 3.00                   | 1.50                 | 2.10                | $2.5 \pm 0.3$         | d1 + 1.0 | d1 + 4.0  |
| 120.VA004   | 3.5 - 4.4          | 3.20               | 3.70                   | 2.00                 | 2.40                | $3.0 \pm 0.4$         | d1 + 1.0 | d1 + 6.0  |
| 120.VA005   | 4.5 - 5.4          | 4.00               | 3.70                   | 2.00                 | 2.40                | $3.0 \pm 0.4$         | d1 + 1.0 | d1 + 6.0  |

## V'RINGS BECA 120VE

### DESCRIPTION

The BECA 120VE profile is a facial effect V'Ring with a large radial section and is used for large dimensions.

### ADVANTAGES

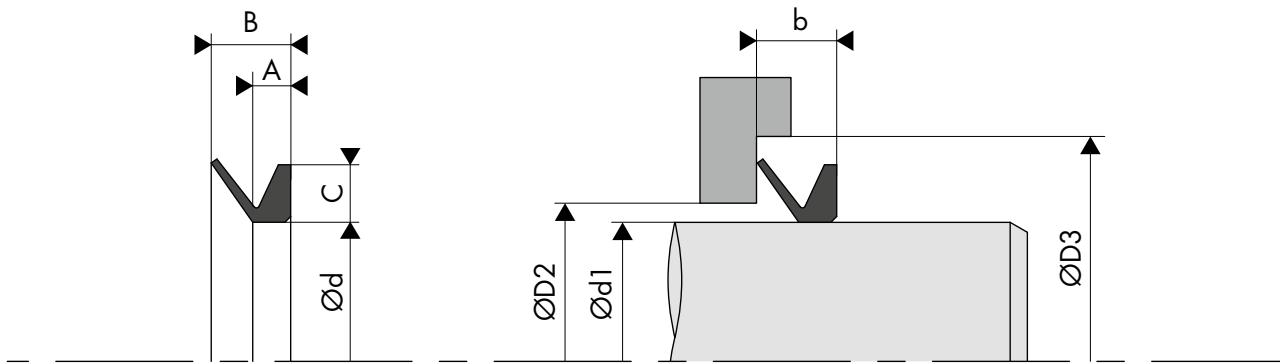

- Excellent chemical compatibility and wide temperature range, depending on the type of material chosen
- Low friction
- Good elasticity
- Used as a secondary seal for heavy-duty applications
- Greater axial movement is possible

### APPLICATIONS

Mobile hydraulics  
Axles

### MATERIALS

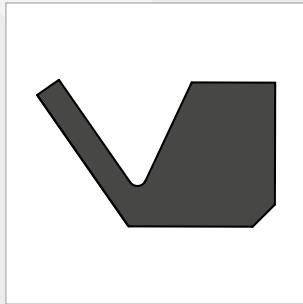

FKM 60 and 70 Shore A  
NBR 60 and 70 Shore A

### DIMENSIONS

# V'RINGS BECA 120VL

## DESCRIPTION

The BECA 120VL profile is a rubber facial effect V'Ring.

## ADVANTAGES

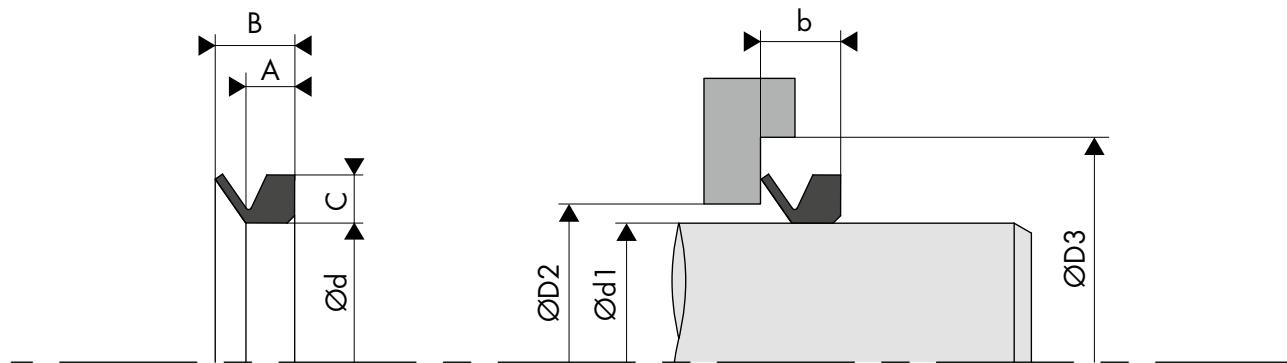

Excellent chemical compatibility and wide temperature range, depending on the type of material chosen  
Low friction  
Good elasticity  
Suitable for confined spaces, substituting labyrinth seals

## APPLICATIONS

General industry

## MATERIALS

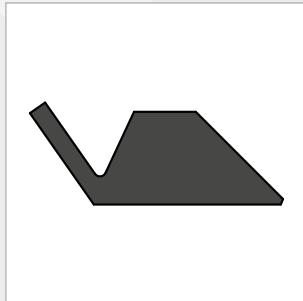

FKM 60 and 70 Shore A  
NBR 60 and 70 Shore A

## DIMENSIONS

## V'RINGS BECA 120VS

### DESCRIPTION

The BECA 120VS profile is a rubber facial effect V'Ring composed of a conical rear face with a large body with a low radial section.

### ADVANTAGES

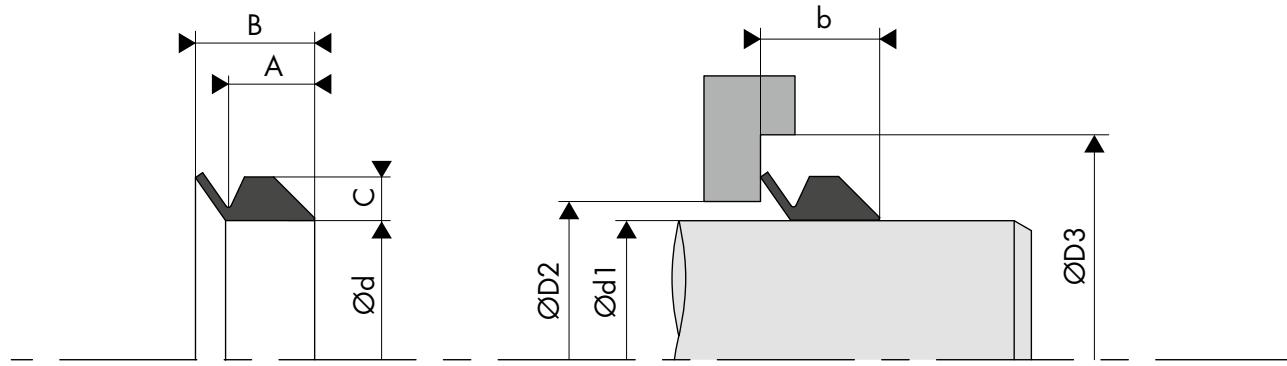

Excellent chemical compatibility and wide temperature range, depending on the type of material chosen  
Low friction  
Good elasticity  
Firm grip on the shaft

### APPLICATIONS

Agriculture  
Automotive

### MATERIALS

FKM 60 and 70 Shore A  
NBR 60 and 70 Shore A

### DIMENSIONS
